

Project Title:

Laundry Appointment System (Mobile App)

Project Description:

The Laundry Appointment System is a simple mobile app that allows customers to book a schedule for their laundry. Instead of waiting in line, users can choose a service, select a date and time, and confirm their appointment.

The system also allows the laundry shop staff to view and manage all appointments. This helps make the process faster, more organized, and convenient for both customers and staff.

Detailed System Flow:

1. User Side (Customer)

- The user opens the mobile app.
- The user logs in or enters their name.
- The user selects a laundry service (wash, dry, or fold).
- The user chooses a date and time.
- The user confirms the appointment.
- The system saves the booking and shows a confirmation message.

2. Admin Side (Staff)

- The staff logs into the system.
- The staff views all appointments.
- The staff checks the customer details and service requested.
- The staff updates the status (pending, ongoing, completed).

3. System Process

Input: User enters booking details

Process: System checks and saves the data

Storage: Data is saved in Firebase

Output: Confirmation is shown on screen
